Customer: Ms. Oda Nimmer  
 Assignment from: 26/09/2023  
 Received: 28/09/2023

#### Assignment:

Nr.	Prüfung	Norm Prüfbedingungen
1.	Specific thermal conductivity $\lambda$	<b>Alambeta-Verfahren</b>  Temperature difference 10 K contact pressure of the plunger 10 cN/cm <sup>2</sup> Number of test specimen: 5
2.	Thermal resistance $r$	<b>Alambeta-Verfahren</b>  Temperature difference 10 K contact pressure of the plunger 10 cN/cm <sup>2</sup> Number of test specimen: 5
3.	Specific heat capacity $c_v$	<b>Alambeta-Verfahren</b>  Temperature difference 10 K contact pressure of the plunger 10 cN/cm <sup>2</sup> Number of test specimen: 5

Durch die DAkkS  
 Deutsche Akkreditierungsstelle GmbH  
 akkreditiertes Prüflaboratorium

In der Anlage zur Akkreditierungsurkunde sind alle akkreditierten Prüfverfahren aufgeführt. Auf Wunsch wird die Urkunde zugestellt.

Sample:

### Woven fabrics

Coding for test	Identification by customer
Sample 1	<u>Woven fabric</u> Article 1315 Material composition: 100 % PES Coat: 100 % PAN FR

**Sampling:** The samples were taken by the customer.

Realisation of the test: The measurement samples were taken and tested in compliance with the above-mentioned regulation.

Testing period: 05/10/2023

Test result:

### 1. Specific thermal conductivity $\lambda$

$\lambda$  = Quantity of heat, which is passing a material with 1 m<sup>2</sup> surface and 1 m thickness per second, if there is a temperature difference of 1 K between both sides.

$\lambda$ in	$\frac{\text{mW}}{\text{m} \cdot \text{K}}$	mW	Milliwatt
		m	meter

$\lambda$	Sample 1	
	right side	reverse side
$\bar{X}$	44.7	43.7
$X_{\max}$	45.7	44.4
$X_{\min}$	44.4	43.0

The lower the value of the specific thermal conductivity, the less heat is transported and dissipated, the better the thermal insulation.

2. Thermal resistance r

$r$  = Temperature difference between the upper side and the reverse side of a material with a surface area of 1 m<sup>2</sup> and a given thickness, if a heat flux of 1 Watt is passing through.

$$r \text{ in } \frac{\text{mK} \cdot \text{m}^2}{\text{W}} \quad \begin{array}{ll} \text{mK} & \text{Millikelvin} \\ \text{m}^2 & \text{square meter} \\ \text{W} & \text{Watt} \end{array}$$

r	Sample 1	
	right side	reverse side
$\bar{x}$	20.7	20.7
$x_{\max}$	21.3	21.0
$x_{\min}$	20.4	20.2

The higher the value of the heat resistance, the poorer the heat is transported and dissipated.

3. Specific heat capacity

$c_v$  = volumic heat storage capacity of a material

$$c_v \text{ in } \frac{\text{mW} \cdot \text{s}}{\text{K} \cdot \text{m}^3} \cdot 10^3 \quad \begin{array}{ll} \text{mW} & \text{Milliwatt} \\ \text{s} & \text{seconds} \\ \text{K} & \text{Kelvin} \\ \text{m}^3 & \text{cubic meter} \end{array}$$

$c_v$	Sample 1	
	right side	reverse side
$\bar{x}$	437.7	459.3
$x_{\max}$	447.5	498.6
$x_{\min}$	424.5	439.2

The higher the value of the heat capacity, the more heat can be stored in volume.

The testing results are exclusively related to the sample under conditions as received.
